

SPLIT FACE HOLLOW AND SOLID CONCRETE BLOCKS

Regular Concrete Blocks have a smooth face and are most often found buried in walls between the exterior brick or stone and the interior drywall.

Split-Face Blocks have a rough texture on one face, which makes for a more aesthetically pleasing look on large exterior walls, requiring no plaster or any further treatment for decoration like painting or cladding with stones etc.

Split-Faced Block or Rock-Faced Block appears to have been hand-chiseled (or "split") to give a much textured look. In reality, twin blocks are casted in a mold as a single unit which is later on cut or split into two in a splitter after the concrete is cured to produce two split faced blocks.

They are ideal for facade and boundary wall applications. A wall made of these blocks entails a 3 in 1 application which is basic wall, plaster and cladding. Hence these are very economical and time saving. These are available in various shades and colors. These split blocks can be used in combination to achieve various options in exterior elevations / facades and boundary walls as shown in the photo gallery.

Nishu's split blocks : They are available mainly in Grey and Off-white color depending on the raw materials. In special case, colors like Red, Yellow, Green etc. can be manufactured but at a very premium price.. Most running size in Hollow block is 390X190X190 mm where one of the faces of 190X390 mm will be textured. Regular solid blocks also can be split as per requirement.
